

LAB 2

Agile Backlog Creation & Sprint Simulation in Jira

Problem Statement

Academic Elective Bidding & Allocation System

Student Name	<u>Prajwal M Angadi</u>
SRN	<u>PES1UG24CS592</u>
Course	Software Engineering
Lab	Lab 2

1. Project and Requirement Selected

Problem Statement: Academic Elective Bidding & Allocation System

Selected Functional Requirement: FR-001

FR-001: The system shall allow students to distribute 100 bidding credits across their ranked elective preferences and validate prerequisite course completions.

Epic created in Jira: Elective Bidding & Preference Management

Epic Description: The Epic groups the work required for students to allocate bidding credits, rank elective preferences, and ensure prerequisite requirements are satisfied during the elective bidding process.

2. Epic and User Stories

Work Item	Priority	Story Points
Elective Bidding & Preference Management (Epic)	High	11 total
Allocate Bidding Credits	High	5
Rank Elective Preferences	High	3
Validate Prerequisites	High	3

User Story 1 — Allocate Bidding Credits | Priority: High | Story Points: 5

As a student, I want to distribute my 100 bidding credits across my preferred elective courses, so that I can participate in the elective allocation process according to my preferences.

User Story 2 — Rank Elective Preferences | Priority: High | Story Points: 3

As a student, I want to rank my preferred elective courses, so that the allocation system can consider my preferences during elective allocation.

User Story 3 — Validate Prerequisites | Priority: High | Story Points: 3

As a student, I want the system to validate whether I have completed the prerequisites for my selected electives, so that I cannot bid for courses for which I am not eligible.

3. Jira Backlog Screenshot

The Jira backlog should show the Epic with its three User Stories, together with their priorities and story points.

Story Point Screenshot:

4. Sprint Simulation

The three selected user stories are planned for Sprint 1. The sprint follows the Scrum workflow: To Do → In Progress → Done.

Sprint	Sprint 1
Planned Work	3 User Stories
Total Estimate	11 Story Points
Sprint Duration	1 week

5. Active Sprint Board Screenshot

The final simulated board should demonstrate stories distributed across To Do, In Progress, and Done.

6. Burndown Chart Screenshot

7. Reflection

1. Did your estimations reflect the actual effort?

Yes. The stories were estimated using Fibonacci-style story points based on relative effort, complexity, and uncertainty. Allocate Bidding Credits was assigned 5 points because it represents the main functionality of the selected requirement, while Rank Elective Preferences and Validate Prerequisites were assigned 3 points each. The estimates provided a reasonable representation of the effort required in the simulated sprint.

2. Was your backlog well-prioritized?

Yes. The three user stories were derived from FR-001, which is a High-priority functional requirement. The stories were therefore assigned High priority, with Allocate Bidding Credits ranked first because it represents the primary function, followed by Rank Elective Preferences and Validate Prerequisites.

3. How did your simulated sprint align with your plan?

The sprint followed the planned Agile workflow. The three selected user stories were placed into Sprint 1 and progressed through the To Do, In Progress, and Done columns. The Active Sprint view demonstrated the planned work and its simulated progress.

4. What insights did the burndown chart give about your team's capacity?

The burndown chart provided a visual indication of the remaining work as the sprint progressed. With 11 total story points planned across the three stories, the chart helped demonstrate how Jira tracks remaining work and sprint progress. The simulated sprint allowed the planned workload to be monitored against expected progress.

8. Conclusion

The Jira exercise demonstrated the Agile Scrum workflow of converting a functional requirement from the Academic Elective Bidding & Allocation System into an Epic and User Stories, prioritizing and estimating the backlog, planning a sprint, tracking work through the sprint board, and using a burndown chart to analyze progress.
